#### **GENERAL DESCRIPTION**

The ADG704 is a CMOS analog multiplexer, comprising four single channels. This multiplexer is designed on an advanced submicron process that provides low power dissipation yet gives high switching speed, low on resistance, low leakage currents and high bandwidths.

The on resistance profile is very flat over the full analog signal range. This ensures excellent linearity and low distortion when switching audio signals. Fast switching speed also makes the part suitable for video signal switching.

The ADG704 can operate from a single supply range of +1.8 V to +5.5 V, making it ideal for use in battery powered instruments and with the new generation of DACs and ADCs from Analog Devices.

The ADG704 switches one of four inputs to a common output, D, as determined by the 3-bit binary address lines, A0, A1 and EN. A Logic "0" on the EN pin disables the device.

Each switch of the ADG704 conducts equally well in both directions when ON. The ADG704 exhibits break-before-make switching action.

The ADG704 is available in 10-lead µSOIC package.

#### **PRODUCT HIGHLIGHTS**

- +1.8 V to +5.5 V Single Supply Operation. The ADG704 offers high performance and is fully specified and guaranteed with +3 V and +5 V supply rails.
- 2. Very Low  $R_{ON}$  (4.5  $\Omega$  Max at 5 V, 8  $\Omega$  Max at 3 V). At supply voltage of +1.8 V,  $R_{ON}$  is typically 35  $\Omega$  over the temperature range.
- 3. Low On-Resistance Flatness.
- 4. -3 dB Bandwidth Greater than 200 MHz.
- Low Power Dissipation. CMOS construction ensures low power dissipation.
- 6. Fast  $t_{ON}/t_{OFF}$ .
- 7. Break-Before-Make Switching Action.
- 8. 10-Lead µSOIC Package.

NOTES

<sup>1</sup>Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.

<sup>2</sup>Overvoltages at IN, S or D will be clamped by internal diodes. Current should be limited to the maximum ratings given.

#### CAUTION -

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADG704 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.
